

A documented plate reader near Example Avenue & Demo Street.

Type	Plate reader (ALPR)
Identification	Possibly Flock license plate readers
Identification basis	Possible family, based on visible features only
Source status	Community-mapped
Location	Example Avenue & Demo Street
Equipment coordinates	Not disclosed in this export
Observed	September 2026
Source retrieved	September 14, 2026
Last in-person check in source	August 21, 2026
Record	demo-observation-1 (revision 2)
Report generated	2026-09-15 09:10 UTC

What this report does not establish

- Mapping/source claims can be wrong or stale.
- Phone time, GPS and imported metadata are not independently attested.
- A checksum detects a change relative to a known digest; it does not prove the scene, time, location or claim is true.
- These materials do not establish that a camera recorded any person or vehicle.
- Legal admissibility depends on context; the app does not certify it.

A location report is not proof of recording.

Appendix A — Approved redacted photographs

These are rasterized public derivatives with metadata removed. Originals are held privately by the observer and are not included.

media/approved-derivative-01.jpg · 1600×1200 · SHA-256

Appendix B — Claims and sources

Each claim is attributed to a source and labelled with how it is known. A source link is not a verified claim by itself.

Appendix C — Chronology

September 2026 — Observation recorded on device (device clock; not independently attested).

2026-09-14 — Revision 1

2026-09-15 — Revision 2

2026-09-15 — Evidence package exported (profile: public-default).

Appendix D — Methodology

Sightline separates three things: what a source document says, what the observer directly saw, and what is inferred. Each claim carries its basis and source.

Equipment position and photographer position are stored separately. Distance, when shown, is an approximate straight-line (Haversine, $R = 6,371,008.8$ m) distance between two coordinates, not a measure of any camera's field of view.

Original photographs are kept unmodified in the observer's private notebook with a SHA-256 digest computed at acquisition. Shared images are newly rasterized derivatives: crops and solid masks are burnt in, and EXIF/XMP/IPTC metadata and embedded thumbnails are not written.

Map records from OpenStreetMap are community contributions under the ODbL. They can be incomplete, outdated or wrong. Absence of a record does not mean absence of equipment.

Appendix E — Checksums

SHA-256 of the media files in this package at the time of export. Matching checksums show files are unchanged relative to this list; they do not prove the event is authentic.
